Installer Please Note: This equipment has been tested and inspected. It has been shipped free from defects from our factory. However, during shipment and installation, problems such as loose wires, leaks or loose fasteners may occur. **It is the installer's responsibility to inspect and correct any problems that may be found.**

The model and serial numbers are located on the data plate attached to the side of the cooler. Record this information in the spaces provided below.

Model No. __________________________ Serial No. __________________

*This manual may also be used for the following:
Unit Types (UT) - (RT or PV)
Rooftop Arrangements (RA) - (D or E) and
Unit Type (UT) - (AH)
Rooftop Arrangements (RA) - (P or R)
Capacity (CA) - (20 or 40)
RECEIVING INSTRUCTIONS
Inspect shipment immediately after receiving to determine if any damage has occurred during shipment. If any damage is found, the consignee should sign the bill of lading, indicating such damage, and immediately file claim for damage with the transportation company.

GENERAL SAFETY INFORMATION

Unless otherwise specified, the following conversions may be used for calculating SI/metric unit measurements:
1 lb. = 0.453 kg
1 cubic foot = 0.028 m³
1000 Btu per hour = 0.293 kW
1 foot = 0.305 m
1 inch water column = 0.249 kPa
1 inch = 25.4 mm
1 gallon = 3.785 L
1 psig = 6.894 kPa
1000 BTU/cu. ft. = 37.5 MJ/m³
1 liter/second = CFM x 0.472
meter/second = FPM ÷ 196.8

The following terms are used throughout this manual, in addition to the other requirements, to bring attention to the presence of potential hazards or to important information concerning the product:

⚠️ DANGER Indicates an imminently hazardous situation which, if not avoided, will result in death, serious injury or substantial property damage.

⚠️ WARNING Indicates an imminently hazardous situation which, if not avoided, could result in death, serious injury or substantial property damage.

⚠️ CAUTION Indicates an imminently hazardous situation which, if not avoided, may result in minor injury or property damage.

NOTICE: Used to notify of special instructions on installation, operation, or maintenance which are important to equipment but not related to personal injury.

Failure to comply with the General Safety Information may result in extensive property damage, severe personal injury, or death.

⚠️ WARNING Disconnect all power before installing or servicing the unit. If power disconnect is out of sight, lock it in the open position and tag it to prevent unexpected application of power. Failure to do so could result in fatal electrical shock or severe personal injury.

⚠️ WARNING Do not alter the unit in any way, or damage to the unit and/or severe personal injury or death may occur.

⚠️ WARNING Do not depend on a thermostat or other switch as a sole means of disconnecting power when installing or servicing unit. Always disconnect power at the main circuit breaker as described above. Failure to do so could result in fatal electrical shock.

*Capacities - (50, 60, 70 and 80) are for Dual Furnace Unit Types only.

CELdek® EVAPORATIVE MEDIA
The Evaporative Cooler utilizes high efficiency CELdek® media. CELdek® is made from a special cellulose paper, impregnated with insoluble anti-rot salts and rigidifying saturants. The cross fluted design of the pads induces highly-turbulent mixing of air and water for optimum heat and moisture transfer. The evaporative coolers are available with standard 8 or optional 12 inch media which produce high efficiency and high face velocities, along with a 2" distribution pad to disperse the water evenly over the pads.

Mounting to Roof
1. Before positioning the unit in its permanent location, make certain that the roof is capable of carrying the load of this equipment. Note that when the cooler is filled with water, the unit will be much heavier than when dry. See “Performance and Dimension Data” table for appropriate operating weight.
2. If unit is to be mounted on a curb, refer to the curb specifications for installation requirements.
3. Make certain that the mounting surface is level in all directions.
4. Make certain that you have sufficient means for lifting the unit into place.
5. Installation must conform to local and national building and safety codes.
6. The units are mounted on skid rails and are suitable for use on combustible flooring. It is recommended that the skids be mounted either on solid planking or on steel channels, but never on a soft tar roof where the skids could sink and reduce the 4” clearance between the bottom pan and the roof.
7. Inspect all internal parts of the cooler section to determine if any damage has occurred during shipment. See roof curb specifications at the end of the manual.

Connecting the Water Supply

NOTICE: Soft water equipment should not be attached to water lines going to the cooler. “Soft Water” will cause corrosion and decrease the effective life of the cooler.

1. A water valve should be installed at a convenient location to allow water to be turned on and off. Use 1/4” tubing to supply water to Evaporative Cooler. A water connector kit is available at your local wholesaler.
2. Place tube nut and ferrule over the end of the tubing.
3. Insert tubing into factory-installed float valve and tighten securely.

Figure 7 - Float Valve Assembly

NOTICE: There will be a slight odor during the initial start-up of the unit. The odor will disappear within the first few days of operation if the bleed-off is adjusted correctly.

Faucet Use
1. To connect the water line to the water supply, install a silcock and water valve on the faucet.
2. Place tubing nut and ferrule on tube end, and insert valve.
3. Tighten the nuts on the valve and the tube.

NOTICE: If a faucet is not to be used for the water supply, install the valve on the water line to be used. Follow the procedure above for securing the tubing to the valve.
Adjusting the Water Level and Float Valve
Fill the tank as follows:
1. Turn the water supply on. Fill the tank to a depth of approximately 3.25" (82.6mm). While filling the tank, check for good pressure and flow from the float valve.
2. The float valve should shut down the water supply at the 3.25" (82.6mm) level. It may be necessary to adjust the float valve by bending the rod. The rod level adjustment screw should be set in lower notch on lever.
3. Check the tank and all connections for leaks.

NOTE: The overflow fitting is set so that the water will begin to flow at the 3.25" (82.6mm) depth. It is important that the water level not be above the pump basket screen!

Adjusting the Water Flow
Proper water flow over the media is important. Insufficient water flow will result in increased accumulation of minerals on the media. Excessive water flow will result in deterioration of the media and moisture carryover.
1. Using the ball valve handle, adjust the water flow so that the media is damp from the top to the bottom. If you can see water flowing on the entering side, your water level is too high. Adjust the valve so that the media is just damp on the entering side. Repeated drying of the media will cause rapid buildup of mineral deposits in the media. Drying is due to improper adjustment of the water flow valve, frequent shut-down of the pump to control the evaporative cooling/humidification, or localized air velocities across the surface of the media. The area where dry spots occur will exhibit high mineral deposits. The valve must be adjusted so that no dry spots appear on entering or leaving side, and when adjusted correctly, enough water will flow through the media to wash out most of the airborne dirt and other debris.
2. Prior to start-up, it is recommended that the tank be filled, and the pump turned on, allowing the unit to run for approximately 10 minutes. Repeat this procedure two times to help flush any dirt that may have accumulated during shipping.

Bleed-Off
Bleed-Off is required to maintain the water quality of the system. When water evaporates, minerals and other impurities are left behind, impurities are scrubbed from the air flowing through the system, and make-up water (even good quality make-up water) adds more minerals and impurities. These form deposits on the media during the evaporative process. Therefore, it is important to bleed-off a small quantity of recirculating water to keep the concentration of impurities under control. The bleed-off rate required is dependent upon the quality of the water used and the rate of evaporation. As climate conditions change, the rate of evaporation may increase, requiring an increase in the bleed-off rate. It is recommended that the bleed-off rate be adjusted for the maximum water evaporation. An indication of insufficient bleed-off is a uniform build-up of minerals on the entering air face of the media. If this condition is observed, increase the rate of bleed-off until the mineral deposits dissipate.

Adjusting the Bleed-Off
1. The bleed-off is attached to the PVC tee. This bleed-off system will eliminate a small quantity of water from recirculation, which will reduce scale build-up. This water will drain through the attached tube, and out through the overflow. Disposal of this water should comply with local codes.
2. Adjust the bleed-off rate according to Table 4.

Table 4

<table>
<thead>
<tr>
<th>Unit Size Capacity</th>

</table>

Prior to start-up, it is recommended that the tank be filled, and the pump turned on, allowing the unit to run for approximately 10 minutes. Repeat this procedure two times to help flush any dirt that may have accumulated during shipping.
ELECTRICAL CONNECTIONS

**WARNING**
HAZARDOUS VOLTAGE!
DISCONNECT ALL ELECTRIC POWER INCLUDING REMOTE DISCONNECTS BEFORE SERVICING. Failure to disconnect power before servicing can cause severe personal injury or death.

Refer to the unit data plate to determine the supply voltage.

**WARNING**
Do not service before disconnecting power or there could be a potential for an electrical shock hazard.

The motor name-plate and electrical rating on the transformer should be checked before energizing the unit electrical system. All external wiring must conform to ANSI/NFPA No. 70-1996, National Electrical Code (or the latest edition of) and applicable local codes; in Canada, to the Canadian Electrical Code, Part 1 CSA Standard C22.1

“Dashed” lines represent either field wiring (by others) or optional equipment. Refer to optional items (shown on wiring diagram included with unit) - these will be hard wired.

**WARNING**
Do not jumper factory wiring. Mis-wiring of safety circuits may result in fire or death.

NOTICE: For all wiring connections, refer to the wiring diagram shipped with the unit (either affixed to the side jacket or enclosed in the unit’s installation instruction envelope). Should any original wire supplied with the unit have to be replaced, it must be replaced with wiring material having a temperature rating of at least 105°C.

**CAUTION**
Do not use any tools (i.e. screwdriver, pliers, etc.) across the terminals to check for power. Use a voltmeter.

**CAUTION**
USE COPPER CONDUCTORS ONLY! UNIT TERMINALS ARE NOT DESIGNED TO ACCEPT OTHER TYPES OF CONDUCTORS. Failure to do so may cause damage to the equipment.

It is recommended that the electrical power to each unit be provided by a separate, fused, and permanently live electrical circuit. A disconnect switch of suitable electrical rating for each unit should be placed as close to the controls as possible. Each unit must be electrically grounded in accordance with the latest edition of the National Electrical Code, ANSI/NFPA No. 70-1996, or CSA Standard C22.1. Sample wiring connections are depicted in Figures 9 & 10.

NOTICE: Consult the factory before making any changes to factory wiring.

**OPTIONAL FILL AND DRAIN KIT:** Optional Evaporative Cooler Fill and Drain Kit consists of two motorized valves, installed in the building, and piped and wired to the roof. The kit eliminates the need to go to the roof to fill or drain the cooler for seasonal changeover, and automatically maintains the water level. See sample Figure 10. Refer to the kit’s instruction.

**GROUNDING:** Install a ground wire to suitable ground according to local codes.
Open all disconnect switches and secure in that position before servicing unit. Failure to do so may result in personal injury or death from electrical shock.

Because of the nature of the evaporative process, algae buildup, biological fouling, scale build-up, and corrosion are distinct possibilities. Proper water treatment and regularly scheduled maintenance will minimize or eliminate most problems.

a.) Cooling Pad Check List:
   √ Reduce the number of on/off cycles.
   √ Shade the pads and pump.
   √ Dry pads out completely once every 24 hours.
   √ Maintain a suitable water bleed-off rate.
   √ Drain and disinfect the entire water system quarterly.
   √ Avoid harmful contaminants, including dust, fumes, harsh cleaners, and water treatment chemicals.
   √ Circulate the recommended quantity of water over the pads.
   √ Avoid dry areas on the pads.
   √ Clean the filters regularly.

b.) Controlling Algae:
   Scale and mineral deposits can form on the cooling pad because the mineral content of the water is too high.

   Increase the water flow over the face of the pads.
   Make certain that the flow of water is even from one end of the distribution pipe to the other end.
   Clean and flush the distributor pipe regularly; especially if dry areas appear on the pads.
   Maintain the pH of the recirculating water between 6 and 8.
   Maintain sufficient bleed-off rate.

   For more details, check MUNTERS® Engineering Bulletin EB-WTM-502 (included with this manual).

c.) Preventing Algae in the Evaporative Pads:
   Algae needs light, moisture, and nutrients to survive. Eliminating, or reducing, these elements will help to control algae. For specific details, see MUNTERS® Engineering Bulletin EB-WTM-502 (included with this manual).

d.) Biological Fouling Control:
   Uncontrolled growth of organic matter can lead to plugged media, metal deterioration, and biological contamination of the airstream. Whenever the possibility of biological contamination of water in an airstream exists, transmittal of Legionnaire’s Disease should be addressed. While there are no reported cases of Legionnaire’s Disease associated with rigid media type evaporative cooling systems, the Legionella Pneumophila bacteria is present in almost all water supplies. However, the mere presence of the bacteria does not create a hazard: the bacteria must be transmitted as an aerosol in sufficient densities to be infectious.

NOTICE: It is highly recommended that the services of a water treatment company be retained to advise on the proper treatment of the sump water for biological, scale, and corrosion control. For more information, see MUNTERS® Engineering Bulletin EB-WTM-502 (included with this manual).

MAINTENANCE

Maintenance Schedule

Regular maintenance is the key to successful service from your Evaporative Cooler. Use the following schedule as a guide to maintain you unit:

<table>

Following are explanations of the procedures outlined in the above schedule.

Changing the Media
This should be done every 5 years or if passages become blocked.
1. Remove filter/frame assemblies.
2. Disconnect the water hood panel from the top panel by removing screws.
3. Snap out water distribution system.
4. Remove top media distribution pad.
5. Lift out media sections (Note the position of media with respect to airflow. See Figure 11)
6. Replace with new CELdek® media sections. (See replacement part section). Aspen and other evaporative media will not work.
7. When re-installing media, be sure all media sections are installed in the proper direction. See Figure 11.
8. Replace top media distribution pad, water distribution system, water hood panel, and filter/frame assemblies.

**Washing the Media**

⚠️ **CAUTION** Avoid splashing water on the blower motor at all times (this could cause electrical problems!)

1. Scale and dust should be washed off the intake side of the media annually, using a garden hose and nozzle; this will help to unclog passages.
2. Using a stiff brush, lightly brush the intake edges of the media. This will not harm the openings, but will remove any hardened scale.
3. Occasionally, there will be a build-up of algae or odors. The best solution for both of these problems is to allow the pads to dry thoroughly on a regular basis. If cooling is not needed at night during the cooling season, allow the blower to run for a few hours after the pump has been shut-down to dry pads daily.
4. During the cooling season, we recommend that the pads be shut down nightly if possible with the blower running to dry the pads out for a few hours before the unit is shut down.

**Washing the Inlet Filter**
The pre-filter should be cleaned periodically as follows:

1. Turn the four latches and remove filter frame assemblies.
2. Carefully remove the aluminum filters. Wash the filters with warm water and a mild soap, rinse thoroughly.
3. Re-install in unit.
4. If the aluminum mesh filters are damaged or cannot be cleaned, replace the mesh filter (See replacement parts section).

**Cabinet Cleaning and Touch-Up**
The cabinet and all internal parts of the Evaporative Cooler should be cleaned annually using a soft cloth, warm water, and a mild cleanser.

**NOTE:** Avoid using steel wool or sandpaper in normal cleaning of the unit.

**Winter Shut Down**

1. Clean and flush out Evaporative Cooler media and sump.
2. Clean water distributor holes.
3. Drain fill pipe and leave open. **DO NOT LEAVE ANY WATER IN THE SYSTEM. FREEZING CAN CAUSE MAJOR DAMAGE TO THE UNIT.**
4. Remove and clean pump if necessary.
5. Check sump tank for leaks and repair if necessary. Sump tank is fabricated from stainless steel.

---

**Cleaning the Water Pump**

⚠️ **CAUTION** Do not allow the pump to topple over or become submerged. Water will damage the pump motor. This is not a submersible pump.

Disassemble and clean water pump as follows:
1. Disconnect power.
2. Disconnect the liquid tight connector from the junction box to remove cord and connector.
3. Disconnect the pump mounting bracket and hose.
4. Remove the pump and basket screen.
5. To clean pump, snap out base of the pump; notice the impeller.
6. Using a mild detergent solution, wash all deposits from the impeller and the impeller base plate.
7. Spin the impeller to dislodge any foreign material. Make sure that the impeller spins freely.
8. Carefully snap the impeller and impeller base plate back onto the pump.
9. Wash the pump basket screen using the same detergent solution, and rinsing thoroughly to remove any debris. If unable to clean, replace with a new screen (See replacement part section).

**NOTICE:** The pump motor does not require any lubrication.
Roof Curb Kit - RC015* (-1, -2, -3, -4)

For use with:
Unit type (UT) - EV
Capacities (CA) - 10/40
*Evaporative Cooler Platform Only
(Included with Roof Curb Kit No's RC002, RC004, RC008, RC012)

Roof Curb Kit RC015
Contents:
1. Evaporative Cooler Assembly (sold separately)
2. Curb (2 platforms per kit)
3. 1/4-20 "KEPS" Nut (8) required
4. 1/4-20 x 5/8 LG. Hex HD. Bolt (8) required

1 lb. = 0.453 kg

*One Platform Kit fits All Evaporative Cooler Modules/Capacities (CA) - 10/80
Capacities 50, 60, 70 and 80 are for (RT/PV) unit types only.
How to order Replacement Parts

Please provide the following information to your local representative:

- Model Number
- Serial Number (if any)
- Part Description and Number as shown in Replacement Parts Literature

If further assistance is needed, please contact the manufacturer's customer service department.

LIMITED WARRANTY

The complete unit is warranted by the manufacturer to be free from defects in material and workmanship for a period of one (1) year from the date of manufacture.

The manufacturer will repair or replace, at its option, any component which, upon inspection, it finds to be defective, provided that the unit has been operated within its listed capacity, has been installed in accordance with the furnished instructions, has not been misused or subjected to negligence and has received reasonable and necessary maintenance. The warranty does not cover labor costs or other costs incurred in repairing, removing, installing, servicing or handling of parts or completed products.

The warranty does not cover loss due to corrosion by chemicals precipitated in the air such as halogenated hydrocarbons. The manufacture will in no event be liable for incidental or consequential damages of any kind whatsoever.

Written permission is required prior to the return of defective components. All returns must be sent with all transportation charges prepaid to the plant designated in the written permission.

This warranty is extended only to the original owner of the unit.
